GENERAL TRIPLE SERIES IDENTITY, LAURENT TYPE GENERATING RELATIONS AND APPLICATIONS

MOHAMMAD IDRIS QURESHI, MAHVISH ALI AND DILSHAD AHAMAD

ABSTRACT. The main aim of this article is obtain certain Laurent type hypergeometric generating relations. A general triple series identity is established. By using triple series identity, a Laurent type hypergeometric generating relation is derived. Explicit expressions of some hybrid special functions related to the Bessel functions are also established as applications.

1. Introduction and preliminaries

The generalized hypergeometric functions and their extensions in the form of basic (or \( q \)-) hypergeometric functions, elliptic hypergeometric functions and multiple hypergeometric functions are ubiquitous. One characteristic of these functions is a tendency to appear in a variety of mathematical and physical circumstances. A natural generalization of the Gaussian hypergeometric series \( {}_2F_1[\alpha, \beta; \gamma; z] \), is accomplished by introducing any arbitrary number of numerator and denominator parameters. Thus, the resulting series

\[
{}_{p}F_{q}\left[\begin{array}{c}
\alpha_{1}, \alpha_{2}, \ldots, \alpha_{p} \\
\beta_{1}, \beta_{2}, \ldots, \beta_{q}
\end{array} ; z \right]
= \sum_{n=0}^{\infty} \frac{(\alpha_{1})_{n}(\alpha_{2})_{n} \ldots (\alpha_{p})_{n}}{(\beta_{1})_{n}(\beta_{2})_{n} \ldots (\beta_{q})_{n}} \frac{z^{n}}{n!}
\]

is known as the generalized hypergeometric series, or simply, the generalized hypergeometric function. Here \( p \) and \( q \) are positive integers or zero and we assume that the variable \( z \), the numerator parameters \( \alpha_{1}, \alpha_{2}, \ldots, \alpha_{p} \) and the denominator parameters \( \beta_{1}, \beta_{2}, \ldots, \beta_{q} \) take on complex values, provided that

\[ \beta_{j} \neq 0, -1, -2, \ldots \; ; \; j = 1, 2, \ldots, q. \]

In contracted notation, the sequence of \( p \) numerator parameters \( \alpha_{1}, \alpha_{2}, \ldots, \alpha_{p} \) is denoted by \( (\alpha_{p}) \) with similar interpretation for others throughout this paper.

2010 Mathematics Subject Classification. 33B15, 33C10, 33C20.

Key words and phrases. Generalized hypergeometric functions; Laurent type generating relations; Triple series identity; Bessel functions.

Submitted October 01, 2019.
Supposing that none of numerator parameters is zero or a negative integer and for \( \beta_j \neq 0, -1, -2, \ldots; j = 1, 2, \ldots, q \), we note that the \( _pF_q \) series defined by equation \( [1] \):

\[
(i) \text{ converges for } |z| < \infty, \text{ if } p \leq q
\]

\[
(ii) \text{ converges for } |z| < 1, \text{ if } p = q + 1
\]

\[
(iii) \text{ diverges for all } z, \ z \neq 0, \text{ if } p > q + 1.
\]

Fox-Wright generalized hypergeometric function of one variable

\[
_p\Psi_q \begin{pmatrix} (\alpha_1, A_1), \cdots, (\alpha_p, A_p) ; \\
(\beta_1, B_1), \cdots, (\beta_q, B_q) ; \\
\end{pmatrix} z = \sum_{n=0}^\infty \frac{\Gamma(\alpha_1 + nA_1) \cdots \Gamma(\alpha_p + nA_p)}{\Gamma(\beta_1 + nB_1) \cdots \Gamma(\beta_q + nB_q)} \frac{z^n}{n!}.
\]

where \( A_1, \cdots, A_p, B_1, \cdots, B_q \) are positive real numbers; subject to the convergence conditions:

\[
(i) 1 + \sum_{i=1}^p B_i - \sum_{i=1}^q A_i > 0 \text{ and } 0 < |z| < \infty; \ z \neq 0
\]

\[
(ii) 1 + \sum_{i=1}^q B_i - \sum_{i=1}^p A_i = 0 \text{ and } 0 < |z| < A_1^{-A_1} \cdots A_p^{-A_p} B_1^{B_1} \cdots B_q^{B_q}.
\]

Lauricella \[3\] p. 114 introduced fourteen complete hypergeometric functions of three variables and of the second order. He denoted his triple hypergeometric functions by the symbols \( F_1, F_2, F_3, \cdots, F_{14} \) of which \( F_1, F_2, F_3, F_9 \) correspond, respectively, to the three variable Lauricella functions \( F_A^{(3)}, F_B^{(3)}, F_C^{(3)} \) and \( F_D^{(3)} \). The remaining ten functions \( F_3, F_4, F_5, F_6, F_7, F_8, F_{10}, \cdots, F_{14} \) of Lauricella’s set apparently fell into oblivion. Saran \[6\] initiated a systematic study of these hypergeometric functions of three variables, Srivastava \[7, 8\] noticed the existence of three additional complete triple hypergeometric functions of second order; these functions \( H_A, H_B \) and \( H_C \) had not been included in Lauricella’s conjecture, nor they previously mentioned in the literature.

A general triple hypergeometric series was introduced by Srivastava \[9\] which is a unification of Lauricella’s fourteen hypergeometric functions \( F_1, \cdots, F_{14} \) and three additional functions \( H_A, H_B \) and \( H_C \) of Srivastava and is defined as \[9\] p.
where
\[
\Lambda(m, n, p) = \frac{\prod_{j=1}^{A} (a_j)_{m+n+p} \prod_{j=1}^{B} (b_j)_{m+n} \prod_{j=1}^{B'} (b'_j)_{n+p} \prod_{j=1}^{B''} (b''_j)_{p+m} \prod_{j=1}^{C} (c_j)_{m} \prod_{j=1}^{C'} (c'_j)_{n} \prod_{j=1}^{C''} (c''_j)_{p}}{\prod_{j=1}^{E} (e_j)_{m+n+p} \prod_{j=1}^{G} (g_j)_{m+n} \prod_{j=1}^{G'} (g'_j)_{n+p} \prod_{j=1}^{G''} (g''_j)_{p+m} \prod_{j=1}^{H} (h_j)_{m} \prod_{j=1}^{H'} (h'_j)_{n} \prod_{j=1}^{H''} (h''_j)_{p}}
\]
and \((a_A)\) abbreviates the array of \(A\) parameters \(a_1, \cdots, a_A\) with similar interpretations for \((b_B)\), \((b'_B)\), \((b''_B)\), \(\cdots\), et. cetera. The triple hypergeometric series \(7\) converges absolutely when
\[
1 + E + G + G' + H' - A - B - B' - C' - C'' \geq 0,
\]
\[
1 + E + G + G' + H'' - A - B - B' - C'' \geq 0,
\]
and
\[
1 + E + G' + G'' + H''' - A - B' - B'' - C''' \geq 0,
\]
where the equalities hold true for suitably constrained values of \(|x|, |y|\) and \(|z|\).

About five decades ago, Srivastava and Daoust [10] first considered the two-variable case of their multiple hypergeometric function [11, p.454]; see also [12]. For the sake of ready reference, we choose to recall here their definition only in the two-variable case as follows [10, p.199, Eqn (2.1)]:
\[
F^{(3)}_{C:D;D'}(x, y) = \sum_{m,n,p=0}^{\infty} \frac{x^m y^n z^p}{m! n! p!}
\]
where
\[
F^{(3)}_{C:D;D'}(x, y, z) = \sum_{m,n,p=0}^{\infty} \frac{x^m y^n z^p}{m! n! p!}
\]
and
\[
1 + E + G + G' + H' - A - B - B' - C' - C'' \geq 0,
\]
\[
1 + E + G + G' + H - A - B - B' - C'' \geq 0,
\]
and
\[
1 + E + G' + G'' + H''' - A - B' - B'' - C''' \geq 0,
\]
with equality only when \(|x|, |y|\) are constrained appropriately (see, for details, [12]). Here, for the sake of convenience, \([(a_A) : \theta, \phi]\) represents the set of “\(A\)” number of parameters \([a_1 : \theta_1, \phi_1], [a_2 : \theta_2, \phi_2], \ldots, [a_A : \theta_A, \phi_A]\). The values of positive real coefficients \(\theta_1, \theta_2, \ldots, \theta_A\) may be equal or different with similar
interpretation for coefficients $\phi_1, \phi_2, \ldots, \phi_A$ and others.

**Remark 1.1.** The positivity of these coefficients was assumed by Srivastava-Daoust [12, pp. 153-158] in order merely to facilitate their investigations of the region of convergence of the multiple hypergeometric series [10].

**Remark 1.2.** For notational purposes the coefficients $\xi_j, \zeta_j, \theta_j, \psi_j, \eta_j, \zeta'_j, \psi'_j$ are allowed to take on all real values including, for example, zero and negative integers, see [13, pp.270-272]. Many useful cases of reducibility of double hypergeometric functions are known to exist when the coefficients $\theta, \phi, \psi, \psi', \xi, \eta, \zeta$ and $\zeta'$ in equation (10) are chosen to be unity.

**Lemma 1.1.** [14, p.100, Eqn(2)]
\[
\sum_{n=0}^{\infty} \sum_{k=0}^{n} B(k, n) = \sum_{n=0}^{\infty} \sum_{k=0}^{\infty} B(k, n+k),
\] (13)
provided that concerned double series are absolutely convergent.

**Lemma 1.2.** [14, p.102, Eqn(16)] For positive integers $m_1, \ldots, m_r$ ($r \geq 1$),
\[
\sum_{n=0, k_1, \ldots, k_r=0}^{\infty} \sum_{n=0}^{\infty} \sum_{k_1, \ldots, k_r=0}^{m_1k_1+\cdots+m_rk_r\leq n} \Theta(k_1, \ldots, k_r; n) = \sum_{n=0}^{\infty} \sum_{k_1, \ldots, k_r=0}^{\infty} \Theta(k_1, \ldots, k_r; n-m_1k_1-\cdots-m_rk_r),
\] (14)
provided that concerned multiple series are absolutely convergent.

**Definition 1.1.** Gauss’s Multiplication Theorem [14, p.23]
For every positive integer $m$, we have
\[
(\lambda)_{mn} = m^{mn} \prod_{j=1}^{m} \left(\frac{\lambda + j - 1}{m}\right)_n, \quad n = 0, 1, 2, \ldots.
\] (15)

Bessel functions appear in a wide variety of physical problems. The hypergeometric forms of the ordinary Bessel functions $J_\nu(x)$ and modified Bessel functions $I_\mu(x)$ are defined as follows:
\[
J_\nu(x) = \frac{\left(\frac{x}{2}\right)^\nu}{\Gamma(\nu + 1)} {}_0F_1 \left[ \begin{array}{c} \vdots \\ \nu + 1 \\ \vdots \end{array} ; -\frac{x^2}{4} \right],
\] (16)
and
\[
I_\mu(x) = \frac{\left(\frac{x}{2}\right)^\mu}{\Gamma(\mu + 1)} {}_0F_1 \left[ \begin{array}{c} \vdots \\ \mu + 1 \\ \vdots \end{array} ; \frac{x^2}{4} \right],
\] (17)
respectively.

Tricomi functions $C_\nu(x)$ are Bessel like functions which are defined as:
\[
C_\nu(x) = \frac{1}{\Gamma(\nu + 1)} {}_0F_1 \left[ \begin{array}{c} \vdots \\ \nu + 1 \\ \vdots \end{array} ; -x \right]
\] (18)
and have the following relationship with Bessel functions:
\[ C_{\nu}(x) = x^{-\frac{\nu}{2}} J_{\nu}(2\sqrt{x}). \]  
(19)

The Hermite polynomials \( H_n(x) \) are defined as:
\[ H_n(x) = (2x)^n \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \left( 1 \right)^k \left( \frac{t}{1} \right)^k = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} \left( \frac{t}{1} \right)^k = \frac{\exp\left(\frac{x^2}{2}(t-\frac{1}{t})\right)}{\sum_{n=0}^{\infty} H_n(x) t^n}. \]  
(20)

The importance of the generalized Bessel functions stems from their wide use in applications and from their implications in different fields of applied mathematics and physics.

In [3], monomiality principle is used to develop a systematic treatment of Bessel functions of Hermite and Laguerre type. The Hermite-Bessel functions \( H_J^J_n(x,y) \) and Laguerre-Bessel functions \( L_J^J_n(x,y) \) are defined by the following generating functions:
\[ \exp\left(\frac{x^2}{2}(t-\frac{1}{t})+y^2\left(\frac{t}{1}\right)^2\right) = \sum_{n=-\infty}^{\infty} H_J^J_n(x,y) t^n, \]  
(21)

and
\[ C_0 \left( \frac{x}{2} \left( t - \frac{1}{t} \right) \right) \exp\left( \frac{y}{2} \left( t - \frac{1}{t} \right) \right) = \sum_{n=-\infty}^{\infty} L_J^J_n(x,y) t^n, \]  
(22)

respectively.

In 2018, Khan et. al. [4] introduced the Laguerre-Gould-Hopper-Bessel functions \( L_{H(m,r)}^n(x,y,z) \) by using the operational techniques.

The Laguerre-Gould-Hopper-Bessel functions \( L_{H(m,r)}^n(x,y,z) \) are defined by the following generating function [4, p. 388]:
\[ C_0 \left( \frac{x}{2m} \left( t - \frac{1}{t} \right) \right)^m \exp\left( \frac{y}{2} \left( t - \frac{1}{t} \right) \right) = \sum_{n=-\infty}^{\infty} L_{H(m,r)}^n(x,y,z) t^n. \]  
(23)

For the Laguerre-Gould-Hopper-Bessel functions \( L_{H(m,r)}^n(x,y,z) \), the following explicit representation holds [4, p. 389]:
\[ L_{H(m,r)}^n(x,y,z) = \sum_{k=0}^{r+s+m} \sum_{s,l=0}^{n+2k} \frac{(-1)^k(n+2k)!z^s y^n+2k-rs-ml}{2^n+k! \Gamma(1+n+k)s!(l)!^2(n+2k-rs-ml)!}. \]  
(24)

Recently, Ali and Qureshi [1] introduced the extended form of Laguerre-Gould-Hopper-Bessel functions \( G_{n,\lambda}^{(m,r)}(x,y,z;\xi) \) by combined use of integral transform and operational rules, which are defined by the following generating function:
\[ C_0 \left( \frac{x}{2m} \left( t - \frac{1}{t} \right)^m \right) \exp\left( \frac{y}{2} \left( t - \frac{1}{t} \right) \right) = \sum_{n=-\infty}^{\infty} G_{n,\lambda}^{(m,r)}(x,y,z;\xi) t^n. \]  
(25)
The generalized hybrid Bessel functions \( \mathcal{G}_{n,\lambda}^{(m,r)}(x, y, z; \xi) \) have the following explicit representation:

\[
\mathcal{G}_{n,\lambda}^{(m,r)}(x, y, z; \xi) = \frac{1}{\xi^x} \sum_{k=0}^{\infty} \sum_{s,\ell=0}^{rs + m\ell \leq n + 2k} \frac{(-1)^k(n + 2k)!(-\lambda)_{x} x^{s} y^{n + 2k - rs - m\ell}}{2^{n + 2k} \xi^{s} \Gamma(1 + n + k)s!\ell!^2(n + 2k - rs - m\ell)!}
\]

or

\[
\mathcal{G}_{n,\lambda}^{(m,r)}(x, y, z; \xi) = \frac{1}{\xi^x} \sum_{k=0}^{\infty} \frac{(-1)^k y^{n + 2k}}{2^{n + 2k} k!(n + k)!} \Phi_{1;0}^{1;0} \left( \left[-n - 2k : r, m \right] ; [\lambda : 1] ; \ldots ; \frac{z}{\xi(-y)^{r} \cdot (-y)^{m}} \right)
\]

where \( \Phi_{1;0}^{1;0} \) is the Srivastava-Daoust double hypergeometric function defined by equation (26).

In Section 2, a general triple series identity is derived. Section 3 is dedicated to obtain the Laurent type hypergeometric generating relations. In Section 4, some special cases of the obtained results are presented.

## 2. General triple series identity

In this section, we derive a triple series identity in the form of the following theorem:

**Theorem 2.1.** Let \( \{\Delta(\ell)\}, \{\Theta(\ell)\}, \{\Xi(\ell)\}, \{\Upsilon(\ell)\}, \{\Phi(\ell)\}, \{\Psi(\ell)\} \) and \( \{\Omega(\ell)\}; \ell \in \{1, 2, 3, \ldots\} \) are seven bounded sequences of arbitrary complex numbers, where \( m \) and \( r \) are positive integers and \( \Delta(0) \neq 0, \Theta(0) \neq 0, \Xi(0) \neq 0, \Upsilon(0) \neq 0, \Phi(0) \neq 0, \Psi(0) \neq 0, \Omega(0) \neq 0 \). Then

\[
\sum_{\ell,k,s=0}^{\infty} \Delta(\ell + k + s) \Theta(\ell + k) \Xi(k + s) \Upsilon(s + \ell) \Phi(k) \Psi(k) \Omega(s) \times \\
\times \frac{(ax(t - \frac{1}{2})^{m})^{\ell} \left(by(t - \frac{1}{2})^{k} \left(cz(t - \frac{1}{2})^{n}\right)^{s}\right)_{\ell}!}{k!} s!
\]

\[
= \sum_{n=-\infty}^{\infty} \sum_{\ell,j=0}^{m\ell + rs \leq 2j + 2n^* + n} \frac{(-1)^{j+n^*}(2j + 2n^* + n)!}{(j + n^*)! (j + n^* + n)!} \times \\
\times \Delta(2j + 2n^* + n - (m - 1)\ell - (r - 1)s) \Theta(2j + 2n^* + n - (m - 1)\ell - rs) \times \\
\times \Xi(2j + 2n^* + n - m\ell - (r - 1)s) \Upsilon(s + \ell) \Phi(\ell) \times \\
\times \Psi(2j + 2n^* + n - m\ell - rs) \Omega(s) \frac{(ax)^{\ell} \left(by(2j + 2n^* + n - m\ell - rs)(cz)^{s}\right)}{\ell! (2j + 2n^* + n - m\ell - rs)!} s! t^n,
\]

where \( n^* \) is defined as:

\[
n^* = \max \{0, -n\} = \begin{cases} 
-n, & \text{when } n = \cdots, -3, -2, -1 \\
0, & \text{when } n = 0, 1, 2, \cdots,
\end{cases}
\]

provided that each of the multiple series involved is absolutely convergent.
Proof. Suppose the l.h.s. of equation (28) is denoted by $\Lambda$. Then, we have

$$\Lambda = \sum_{\ell, k, s = 0}^{\infty} \Delta(\ell + k + s) \Theta(\ell + k) \Xi(k + s) \Upsilon(s + \ell) \Phi(\ell) \Psi(k) \Omega(s) \times$$

$$\times \frac{(ax)^{\ell} (by)^{k} (cz)^{s}}{\ell! \; k! \; s!} \left( t - \frac{1}{t} \right)^{k + m\ell + rs}. \quad (30)$$

Now, replacing $k$ by $k - m\ell - rs$ and using Lemma [1.2] we get

$$\Lambda = \sum_{k = 0}^{\infty} \sum_{\ell, s = 0}^{k - m\ell - rs \leq k} \Delta(k - (m - 1)\ell - (r - 1)s) \Theta(k - (m - 1)\ell - rs) \times$$

$$\times \Xi(k - m\ell - (r - 1)s) \Upsilon(s + \ell) \Phi(\ell) \Psi(k - m\ell - rs) \Omega(s) \times$$

$$\times \frac{(ax)^{\ell} (by)^{k - m\ell - rs} (cz)^{s}}{\ell! \; (k - m\ell - rs)! \; s!} \left( t - \frac{1}{t} \right)^{k}. \quad (31)$$

On replacing $k$ by $k + j$ in equation (31) and using Lemma [1.1] we obtain

$$\Lambda = \sum_{k = 0}^{\infty} \sum_{j = 0}^{k - m\ell - rs \leq k + j} \frac{(-1)^{j} k!}{j! \; k!} \times$$

$$\times \sum_{\ell, s = 0}^{k + j - m\ell - (r - 1)s} \Delta(k + j - (m - 1)\ell - (r - 1)s) \Theta(k + j - (m - 1)\ell - rs) \times$$

$$\times \Xi(k + j - m\ell - (r - 1)s) \Upsilon(s + \ell) \Phi(\ell) \Psi(k + j - m\ell - rs) \Omega(s) \times$$

$$\times \frac{(ax)^{\ell} (by)^{k + j - m\ell - rs} (cz)^{s}}{\ell! \; (k + j - m\ell - rs)! \; s!} \left( t - \frac{1}{t} \right)^{k}. \quad (32)$$

Further, putting $k = j + n$, in equation (32), we find

$$\Lambda = \sum_{n = -\infty}^{\infty} \sum_{j = 0}^{\infty} \frac{(-1)^{j} (2j + n)!}{j! \; (j + n)!} \times$$

$$\times \sum_{\ell, s = 0}^{2j + n - m\ell - rs \leq 2j + n} \Delta(2j + n - (m - 1)\ell - (r - 1)s) \Theta(2j + n - (m - 1)\ell - rs) \times$$

$$\times \Xi(2j + n - m\ell - (r - 1)s) \Upsilon(s + \ell) \Phi(\ell) \Psi(2j + n - m\ell - rs) \Omega(s) \times$$

$$\times \frac{(ax)^{\ell} (by)^{2j + n - m\ell - rs} (cz)^{s}}{\ell! \; (2j + n - m\ell - rs)! \; s!} t^{n}. \quad (33)$$

Since $n$ varies from $-\infty$ to $\infty$ and $j$ varies from 0 to $\infty$, therefore due to the presence of $(j + n)!$ in denominator of above equation, equation (33) can be modified
in the following form:

\[
\Lambda = \sum_{n=-\infty}^{\infty} \sum_{j=n^*}^{\infty} \frac{(-1)^j (2j + n)!}{j! (j + n)!} \times \\
\times \sum_{\ell,s=0}^{m \ell + rs \leq 2j + n} \Delta(2j + n - (m - 1)\ell - (r - 1)s) \Theta(2j + n - (m - 1)\ell - rs) \times \\
\times \Xi(2j + n - m\ell - (r - 1)s) \Upsilon(s + \ell) \Phi(\ell) \Psi(2j + n - m\ell - rs) \Omega(s) \times \\
\times \left( \frac{ax}{(by)^{2j+n-m\ell-rs(cz)^s}} \right)^l \left( \frac{by}{(by)^{2j+n-m\ell-rs(cz)^s}} \right)^m \left( \frac{cz}{(by)^{2j+n-m\ell-rs(cz)^s}} \right)^{2j+n-m\ell-rs} t^n, \tag{34}
\]

where \(n^*\) is defined by equation (29).

On replacing \(j\) by \(j + n^*\) in equation (34), we get equation (28).

In the next section, we derive certain Laurent type hypergeometric generating relations by using the triple series identity (28). It should be noted that in single, double and triple hypergeometric functions, we are assuming that numerator and denominator parameters are neither zero nor negative integers.

### 3. Laurent Type Hypergeometric Generating Relations

**Theorem 3.1.** The following generating function (in terms of general triple hypergeometric series \(F^{(3)}\) of Srivastava) for the Srivastava-Daoust double hypergeometric function \(F^{1+E+U+R+Q+C:G;V}_{D+A+B+P+M\cdot H:W}\) holds true:

\[
F^{(3)} \left[ \begin{array}{c}
(d_D) : (a_A) ; (b_B) ; (c_C) : (g_G) ; (p_P) ; (v_V) ; \\
(e_E) : (u_U) ; (r_R) ; (m_M) : (h_H) ; (q_Q) ; (w_W) ;
\end{array} \right]
ax \left( \frac{t - 1}{t} \right)^m, by \left( \frac{t - 1}{t} \right)^m, cz \left( \frac{t - 1}{t} \right)^m
\]

\[
= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} (-1)^{j+n^*} \frac{(by)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times \\
\times \prod_{i=1}^{D} (d_i)_{2j+2n^*+n} \prod_{i=1}^{A} (a_i)_{2j+2n^*+n} \prod_{i=1}^{B} (b_i)_{2j+2n^*+n} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \times \\
\times \prod_{i=1}^{E} (e_i)_{2j+2n^*+n} \prod_{i=1}^{U} (u_i)_{2j+2n^*+n} \prod_{i=1}^{R} (r_i)_{2j+2n^*+n} \prod_{i=1}^{Q} (q_i)_{2j+2n^*+n}
\]
\[\begin{align*}
&\times F^{1+E+U+R+Q+C;G;V}_{D+A+B+P+M:R;W:} ([2j - 2n^* - n : m,r], [1 - (e_E) - 2j - 2n^* - n : m - 1, r - 1], \\
&[1 - (d_D) - 2j - 2n^* - n : m - 1, r - 1], \\
&[1 - (u_U) - 2j - 2n^* - n : m - 1, r], [1 - (r_R) - 2j - 2n^* - n : m, r - 1], \\
&[1 - (a_A) - 2j - 2n^* - n : m - 1, r], [1 - (b_B) - 2j - 2n^* - n : m, r - 1], \\
&[1 - (q_Q) - 2j - 2n^* - n : m, r], [(c_C) : 1, 1] : [(g_G) : 1]; [(v_V) : 1]; \\
&[1 - (p_P) - 2j - 2n^* - n : m, r], [(m_M) : 1, 1] : [(h_H) : 1]; [(w_W) : 1]; \\
&(-1)^{\theta} \frac{ax}{(by)^m}, (-1)^{\phi} \frac{cz}{(by)^r} \) \right] t^n, \quad t \neq 0,
\end{align*}\]

where
\[\theta = (D - E + A - U)(m - 1) + (B - R + P - Q + 1)m\]

and
\[\phi = (D - E + B - R)(r - 1) + (A - U + P - Q + 1)r,\]

for suitably constrained values of \(|ax (t - \frac{1}{2})^m|, |by (t - \frac{1}{2})| \) and \(|cz (t - \frac{1}{2})^r|, m\)
and \(r\) are positive integers and \(n^*\) is defined by equation \((29)\) and \([1 - (e_E) - 2j - 2n^* - n : m, r]\),
\([1 - (e_2) - 2j - 2n^* - n : m, r]\), \cdots, \([1 - (e_E) - 2j - 2n^* - n : m, r]\), subject to the
following convergence conditions:
\[1 + E + U + M + H - D - A - C - G \geq 0, \quad (36a)\]
\[1 + E + U + R + Q - D - A - B - P \geq 0, \quad (36b)\]
\[1 + E + R + M + W - D - B - C - V \geq 0. \quad (36c)\]

Proof. Taking
\[\Delta(\ell + k + s) = \prod_{i=1}^{D} (d_i)_{\ell+k+s}, \quad \Theta(\ell + k) = \prod_{i=1}^{A} (a_i)_{\ell+k}, \quad \Xi(k + s) = \prod_{i=1}^{B} (b_i)_{k+s},\]
\[\Upsilon(s + \ell) = \prod_{i=1}^{C} (c_i)_{s+\ell}, \quad \Phi(\ell) = \prod_{i=1}^{G} (g_i)_{\ell}, \quad \Psi(k) = \prod_{i=1}^{P} (p_i)_{k}, \quad \Omega(s) = \prod_{i=1}^{V} (v_i)_{s},\]

in general triple series identity \((28)\), applying some algebraic properties of Pochhammer symbols and after simplification, we obtain:
\[
F^{(3)} \left[ \left( \frac{ax}{t} \right)^{m} + \frac{by}{t} + \frac{cz}{t} \right]
\]

\[= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} \sum_{\ell,s=0}^{m \ell + rs \leq 2j + 2n^* + n} (-1)^{j+n^*} \frac{(2j + 2n^* + n)!}{(j + n^*)! (j + n^* + n)!} \times \]

\[\prod_{i=1}^{A} (a_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s)} \prod_{i=1}^{B} (b_i)_{2j+2n^*+n-me^{-(r-1}s} \times \prod_{i=1}^{E} (e_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s} \times \prod_{i=1}^{U} (u_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s} \times \prod_{i=1}^{R} (r_i)_{2j+2n^*+n-me^{-(r-1}s} \times \prod_{i=1}^{M} (m_i)_{s+e} \prod_{i=1}^{H} (h_i)_{e} \prod_{i=1}^{Q} (q_i)_{2j+2n^*+n-me^{-(r-1}s} \times \prod_{i=1}^{P} (p_i)_{2j+2n^*+n-me^{-(r-1}s} \times \prod_{i=1}^{W} (w_i)_{s} \times \prod_{i=1}^{V} (v_i)_{s} \times \prod_{i=1}^{G} (g_i)_{e}\]

\[= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} \sum_{\ell,s=0}^{m \ell + rs \leq 2j + 2n^* + n} (-1)^{j+n^*} \frac{(by)_{2j+2n^*+n}}{(j + n^*)! (j + n^* + n)!} \times \]

\[\prod_{i=1}^{A} (a_i)_{2j+2n^*+n} \prod_{i=1}^{B} (b_i)_{2j+2n^*+n} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \prod_{i=1}^{U} (u_i)_{2j+2n^*+n} \prod_{i=1}^{R} (r_i)_{2j+2n^*+n} \prod_{i=1}^{M} (m_i)_{s+e} \prod_{i=1}^{H} (h_i)_{e} \prod_{i=1}^{Q} (q_i)_{2j+2n^*+n} \prod_{i=1}^{V} (v_i)_{s} \prod_{i=1}^{G} (g_i)_{e} \prod_{i=1}^{W} (w_i)_{s} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \times \sum_{\ell,s=0}^{m \ell + rs \leq 2j + 2n^* + n} \prod_{i=1}^{D} (1 - d_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{U} (1 - u_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{A} (1 - a_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{B} (1 - b_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{E} (e_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s} \times \prod_{i=1}^{R} (r_i)_{2j+2n^*+n-me^{-(r-1}s} \times \prod_{i=1}^{U} (u_i)_{2j+2n^*+n} \prod_{i=1}^{R} (r_i)_{2j+2n^*+n} \prod_{i=1}^{M} (m_i)_{s+e} \prod_{i=1}^{H} (h_i)_{e} \prod_{i=1}^{Q} (q_i)_{2j+2n^*+n} \prod_{i=1}^{V} (v_i)_{s} \prod_{i=1}^{G} (g_i)_{e} \prod_{i=1}^{W} (w_i)_{s} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \times \prod_{i=1}^{D} (1 - d_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{U} (1 - u_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{A} (1 - a_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{B} (1 - b_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{E} (e_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s} \times \prod_{i=1}^{R} (r_i)_{2j+2n^*+n-me^{-(r-1}s} \prod_{i=1}^{U} (u_i)_{2j+2n^*+n} \prod_{i=1}^{R} (r_i)_{2j+2n^*+n} \prod_{i=1}^{M} (m_i)_{s+e} \prod_{i=1}^{H} (h_i)_{e} \prod_{i=1}^{Q} (q_i)_{2j+2n^*+n} \prod_{i=1}^{V} (v_i)_{s} \prod_{i=1}^{G} (g_i)_{e} \prod_{i=1}^{W} (w_i)_{s} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \times \prod_{i=1}^{D} (1 - d_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{U} (1 - u_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{A} (1 - a_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{B} (1 - b_i - 2j - 2n^* - n)_{(m-1)e^{-(r-1}s} \times \prod_{i=1}^{E} (e_i)_{2j+2n^*+n-(m-1)e^{-(r-1}s} \times \prod_{i=1}^{R} (r_i)_{2j+2n^*+n-me^{-(r-1}s}}}
Corollary 3.1. For we deduce the following consequence of Theorem 3.1:

\[
\prod_{i=1}^{Q} (1 - q_i - 2j - 2n^* - n)_{m\ell + rs} \prod_{i=1}^{C} (c_i)_{\ell + s} \prod_{i=1}^{G} (g_i)_{t} \prod_{i=1}^{V} (w_i)_{s} \times
\prod_{i=1}^{P} (1 - p_i - 2j - 2n^* - n)_{m\ell + rs} \prod_{i=1}^{M} (m_i)_{\ell + s} \prod_{i=1}^{H} (h_i)_{t} \prod_{i=1}^{W} (w_i)_{s}
\times (-1)^{(D-E)(m-1)+(A-U)(m-1)+(B-R)m+(P-Q)m+m|}\times
\times (-1)^{(D-E)(r-1)+(A-U)r+(B-R)(r-1)+(P-Q)r+r|}\times
\]

\[
\times (a_x)_{\ell + s} \times (by)_s \times (cz)_{s} \times (t)^{n}.
\]

(37)

On using definition of the Srivastava and Daoust hypergeometric function \[10\] in the r.h.s. of equation \[37\], we obtain assertion \[35\].

\[\square\]

**Remark 3.1.** Taking \(D = A = B = C = E = U = R = M = 0\) in equation \[35\], we deduce the following consequence of Theorem \[3.7\].

**Corollary 3.1.** For \(G \leq H + 1\), \(P \leq Q + 1\), \(V \leq W + 1\) and \(t \neq 0\), the following generating function (in terms of the product of three generalized hypergeometric functions of one variable) for the Srivastava-Daoust double hypergeometric function holds true:

\[
G_{F_H} \left[ \frac{(g_G)}{(h_H)}; ax(t-\frac{1}{t})^m \right] F_{PQ} \left[ \frac{(p_P)}{(q_Q)}; by(t-\frac{1}{t})^r \right] v_{FW} \left[ \frac{(v_V)}{(w_W)}; cz(t-\frac{1}{t})^s \right]
\]

\[
= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*}(by)^{2j+2n^*+n}}{(j+n^*)!(j+n^*+n)!} \prod_{i=1}^{P} (p_i)_{2j+2n^*+n} \times
\times F_{Q+1;G:V}^{Q+1;H:W} \left[ \begin{array}{c}
-2j-2n^* - n : m, r] \vspace{2mm}
1 - (q_Q) - 2j - 2n^* - n : m, r]
\end{array} \right] \times
\times \left[ (g_G) : 1 \right] \cdot \left[ (v_V) : 1 \right] \cdot \left[ (w_W) : 1 \right]
\]

\[
\left[ (h_H) : 1 \right] \times \left[ (w_W) : 1 \right] \cdot \left[ (cz) \times (t)^{n} \times \left( \frac{ax}{(by)^{m}} \times \left( \frac{cz}{(by)^{s}} \right) \right) \right]
\]

(38)

where \(m\) and \(r\) are positive integers and \(n^*\) is defined equation \[29\].

**4. Applications**

In this section, we consider certain special cases of our main result.

I. Taking \(x = 0; P = Q = 0, b = \frac{1}{2}; V = W = 0, r = 2, c = \frac{1}{2}\) in equation \[38\], we get

\[
\exp \left( \frac{y}{2} \left( t - \frac{1}{t} \right) + \frac{z}{4} \left( t - \frac{1}{t} \right)^2 \right)
\]
\[ EJMAA-2020/8(2) \quad \text{GENERAL TRIPLE SERIES IDENTITY} \quad 105 \]

\[ \sum_{n=-\infty}^{\infty} \sum_{j=0}^{n} \frac{(-1)^{j+n^*} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \left( \frac{\sqrt{y}}{i} \right)^{2j+2n^*+n} H_{2j+2n^*+n} \left( \frac{iy}{2\sqrt{z}} \right) t^n. \quad (39) \]

Comparing equation (39) with the equation (21), we find that the Hermite-Bessel functions \( H_n(y, z) \) have the following series definition in terms of the Srivastava-Daoust hypergeometric function:

\[ H_n(y, z) = \sum_{j=0}^{\infty} \frac{(-1)^{j+n} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \left( \frac{\sqrt{y}}{i} \right)^{2j+2n^*+n} H_{2j+2n^*+n} \left( \frac{iy}{2\sqrt{z}} \right). \quad (40) \]

II. Taking \( G = 0, H = 1, h_1 = 1, m = 1, a = -\frac{1}{2}; P = Q = 0, b = \frac{1}{2}; z = 0 \) in equation (38), we get

\[ C_0 \left( \frac{x}{2} \left( t - \frac{1}{t} \right) \right) \exp \left( \frac{y}{2} \left( t - \frac{1}{t} \right) \right) \]

\[ = \sum_{n=-\infty}^{\infty} \sum_{j=0}^{n} \frac{(-1)^{j+n^*} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \left( 1 - \frac{x}{y} \right)^{2j+2n^*+n} t^n. \quad (41) \]

Comparing equation (41) with the equation (22), we find that the Laguerre-Bessel functions \( L_n(x, y) \) have the following series definition:

\[ L_n(x, y) = \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \left( 1 - \frac{x}{y} \right)^{2j+2n^*+n} t^n. \quad (42) \]

III. Taking \( G = 0, H = 1, h_1 = 1, a = \frac{1}{2}; P = Q = 0, b = \frac{1}{2}; V = W = 0, c = \frac{1}{2} \) in equation (38), we get

\[ C_0 \left( -\frac{x}{2m} \left( t - \frac{1}{t} \right)^m \right) \exp \left( \frac{y}{2} \left( t - \frac{1}{t} \right) + \frac{z}{2r} \left( t - \frac{1}{t} \right)^r \right) \]

\[ = \sum_{n=-\infty}^{\infty} \sum_{j=0}^{n} \frac{(-1)^{j+n^*} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times \]

\[ \times F_{1:0;1:0}^{0:1:0} \left( \left[ -2j - 2n^* - n : m, r \right] : - ; - ; \left( -1 \right)^m \frac{x}{y^m}, \left( -1 \right)^r \frac{z}{y^r} \right) t^n. \quad (43) \]

Comparing equation (43) with the equation (23), we find that the Laguerre-Gould-Hopper-Bessel functions \( L_{H(m,r)}(x, y, z) \) have the following series definition in terms of the Srivastava-Daoust hypergeometric function:

\[ L_{H(m,r)}(x, y, z) = \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left( \frac{y}{2} \right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times \]

\[ \times F_{1:0;1:0}^{0:1:0} \left( \left[ -2j - 2n^* - n : m, r \right] : - ; - ; \left( -1 \right)^m \frac{x}{y^m}, \left( -1 \right)^r \frac{z}{y^r} \right). \quad (44) \]
IV. Taking $G = 0$, $H = 1$, $h_1 = 1$, $a = \frac{1}{4}$; $P = Q = 0$, $b = \frac{1}{2}$; $V = 1$, $W = 0$, $v_1 = \lambda$, $c = \frac{1}{2\xi}$ in equation (43), we get

$$
\xi^\lambda C_0 \left(-\frac{y}{x^2} \left(t - \frac{1}{2}\right)^m\right) \exp\left(\frac{y}{x} \left(t - \frac{1}{2}\right)^n\right)
$$

$$
= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left(\frac{y}{x}\right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times
$$

$$
\times F_{1:0;1}^{1:0:1:0} \left([-2j - 2n^* - n : m, r] ; [\lambda : 1] ; [1 : 1] ; (-1)^m \frac{x}{y^m}, (-1)^r \frac{x}{\xi^p} \right) t^n.
$$

Comparing equation (45) with the equation (29), we find that the extended Laguerre-Gould-Hopper-Bessel functions $G_{n,\lambda}^{(m,r)}(x, y, z; \xi)$ have the following series definition in terms of the Srivastava-Daoust hypergeometric function:

$$
G_{n,\lambda}^{(m,r)}(x, y, z; \xi) = \frac{1}{\xi^\lambda} \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left(\frac{y}{x}\right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times
$$

$$
\times F_{1:0;1}^{1:0:1:0} \left([-2j - 2n^* - n : m, r] ; [\lambda : 1] ; [1 : 1] ; (-1)^m \frac{x}{y^m}, (-1)^r \frac{x}{\xi^p} \right)
$$

or

$$
G_{n,\lambda}^{(m,r)}(x, y, z; \xi) = \frac{1}{\xi^\lambda} \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left(\frac{y}{x}\right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)!} \times
$$

$$
\times F_{1:0;1}^{1:1:0} \left([-2j - 2n^* - n : m, r] ; [\lambda : 1] ; [1 : 1] ; (-1)^r \frac{x}{\xi^p}, (-1)^m \frac{x}{y^m} \right),
$$

which is the modified form of the equation (27).

V. Taking $G = 0$, $H = 1$, $h_1 = \nu + 1$, $a = -\frac{1}{4}$; $P = 0$, $Q = 1$, $q_1 = \mu + 1$, $b = \frac{1}{4}$, $z = 0$ in equation (38), we get

$$
\frac{2^{(\nu+\mu)}\Gamma(\nu + 1) \Gamma(\mu + 1)}{x^{\frac{\nu}{2}} y^{\frac{\mu}{2}} (t - \frac{1}{2})^{\frac{\nu+\mu}{2}}} J_{\nu} \left(\sqrt{x} \left(t - \frac{1}{2}\right)^m\right) I_{\mu} \left(\sqrt{y} \left(t - \frac{1}{2}\right)^n\right)
$$

$$
= \sum_{n=-\infty}^{\infty} \sum_{j=0}^{\infty} \frac{(-1)^{j+n^*} \left(\frac{y}{x}\right)^{2j+2n^*+n}}{(j+n^*)! (j+n^*+n)! (\mu+1)_{2j+2n^*+n}} \times
$$

$$
\times 2 \Psi_1 \left([-2j - 2n^* - n, m], (-\mu - 2j - 2n^* - n, m) ; \frac{4^{m-1}(2)}{y} \right) \left(\nu + 1, 1\right) t^n.
$$

(48)
In this article, we have derived certain Laurent type hypergeometric generating relations using a general triple series identity. This approach can be extended to obtain multiple hypergeometric generating relations for other complex special functions by considering the general multiple series identity. This will be taken in forthcoming investigation.
